I WALK SLOWLY BUT NEVER BACKWARDS
Abraham Lincoln
DEVELOPGOODHABITS.COM

TODO Reminders:

Readings are due **before** lecture

- Reading 14 (zybooks) – you should have already done that ☺
- Lab 09 – go to your lab to have the participation points
- Reading 15 (zyBooks)
- Lab 10 – go to your lab to have the participation points
- Reading 16 (zybooks)
- RPA 7

Keep practicing your RPAs in a spaced and mixed manner ☺

Help Desk

| Day	Time : Room
Monday	3 PM - 5 PM : CSB 120
Tuesday	6 PM - 8 PM : Teams
Wednesday	3 PM - 5 PM : CSB 120
Thursday	6 PM - 8 PM : Teams
Friday	3 PM - 5 PM : CSB 120
Saturday	12 PM - 4 PM : Teams
Sunday	12 PM - 4 PM : Teams

I/O Streams

- A stream is a sequence of data.

- A program uses an input stream to read data from a source, one item at a time:
- A program uses an output stream to write data to a destination, one item at time:

OutputStream

- System.out is a predefined OutputStream object reference that is associated with a system's standard output, usually a computer screen.

- The print() and println() methods are overloaded in order to support the various standard data types, such as int, boolean, float, etc., each method converting that data type to a sequence of characters.

InputStream

- System.in is an input byte stream

- When using an InputStream, a programmer must append the clause `throws IOException` when using the method read()
  - A `throws` clause tells the Java virtual machine that the corresponding method may exit unexpectedly due to an exception, which is an event that disrupts a program's execution.

- Instead of reading a byte stream, dealing with IOException, and after it converting the data to a String or other data types, we have been using the Wrapper class named Scanner ☺
  - Scanner scnr = new Scanner(System.in);
  - automatically scanning a sequence of bytes and converting those bytes to the desired data type depending on the type of method we use to read the data (nextLine(), nextInt(), etc.)

Scanner – reading from a String

- When we want to read something from the terminal we use:

    Scanner scnr = new Scanner(System.in);

    - The parameter System.in indicates that we are reading from the terminal.

- Sometimes we may want to read something from a String, so instead of using System.in as a parameter we have a String as a parameter

    String line = "Let me be that I am and seek not to alter me.\n-Thank you!";
    Scanner scanner = new Scanner(line);

Scanner – reading from a String

```java
public class ScannerString {
    public static void main(String args[]){
        String line = "Let me be that I am and seek not to alter me.\n-Thank you!";
        Scanner scanner = new Scanner(line);
        int tokenCounter = 0;
        while(scanner.hasNext()) {
            tokenCounter++;
            System.out.println(scanner.next());
        }
        System.out.println(tokenCounter);
    }
}
```

.hasNext() – returns true if the scanner has another token in its input

.next() – finds and returns the next complete token from this scanner.

Each token is separated by a delimiter, default delimiter is whitespace.

Scanner – What is printed?

```java
public class ScannerString {
    public static void main(String args[]){
        String line = "Let me be that I am and seek not to alter me.\n-Thank you!";
        Scanner scanner = new Scanner(line);
        int tokenCounter = 0;
        while(scanner.hasNext()) {
            tokenCounter++;
            System.out.println(scanner.next());
        }
        System.out.println(tokenCounter);
    }
}
```

Let
me
be
that
I
am
and
seek
not
to
alter
me.
-Thank
you!

Scanner – reading from a String

```java
import java.util.Scanner;

public class ScannerString {
    public static void main(String args[]){
        String line = "Let me be that I am and seek not to alter me.\n-Thank you!";
        Scanner scanner = new Scanner(line);
        int lineCounter = 0;
        while(scanner.hasNext()) {
            lineCounter++;
            System.out.println(scanner.nextLine());
        }
        System.out.println(lineCounter);
    }
}
```

.hasNext() – returns true if the scanner has another token in its input

.nextLine() – advances this scanner past the current line and returns the input that was skipped

Colorado State University

Scanner – What is printed?

```java
import java.util.Scanner;

public class ScannerString {
    public static void main(String args[]){
        String line = "Let me be that I am and seek not to alter me.\n-Thank you!";
        Scanner scanner = new Scanner(line);
        int lineCounter = 0;
        while(scanner.hasNext()) {
            lineCounter++;
            System.out.println(scanner.nextLine());
        }
        System.out.println(lineCounter);
    }
}
```

Let me be that I am and seek not to alter me.
-Thank you!
2

Scanner – reading from a String

```java
import java.util.Scanner;

public class ScannerString {
    public static void main(String args[]){
        String line = "Let me be that I am and seek not to alter me.\n-Thank you!";
        Scanner scanner = new Scanner(line);
        scanner.useDelimiter("-");
        int otherCounter = 0;
        while(scanner.hasNext()) {
            otherCounter++;
            System.out.println(scanner.next());
        }
    }
}
```

.useDemiter(String) - Sets this scanner's delimiting pattern to a pattern constructed from the specified String

What is printed now?

```
Let me be that I am and seek not to alter me.

Thank you!
```

Scanner – what is printed?

```java
import java.util.Scanner;

public class StringLocation {
    public static void main(String args[]){
        String location = "Fort Collins,40°35'6.9288\"N,105°5'3.9084\"W";
        Scanner locScan = new Scanner(location);
        locScan.useDelimiter(",");
        String city = locScan.next();
        String lat = locScan.next();
        String lon = locScan.next();
        System.out.println(city);
        System.out.println(lat);
        System.out.println(lon);
    }
}
```

```
Fort Collins
40°35'6.9288"N
105°5'3.9084"W
```

Scanner – different uses

- When we want to read something from the terminal we use:

  Scanner scnr = new Scanner(System.in);

  – The parameter System.in indicates that we are reading from the terminal.

- When we want to read something from a String we use:

  String line = "Let me be that I am and seek not to alter me.\n-Thank you!";
  Scanner scanner = new Scanner(line);

- What happens if instead of reading from the terminal or a String, we want to read from a file?

  – We need to use the File class!

  – And pass an object of File as a parameter instead of System.in or a String when we construct a Scanner object

Scanner – reading from a File

Basic Structure

```java
import java.io.File;
import java.io.IOException;
import java.util.Scanner;
public class FileReadingBasicStructure {
    public static void readFile(String fileName){
        try {
            Scanner fileIn = new Scanner(new File(fileName));
            // now the file is in a scanner, and looping matters!
            while(fileIn.hasNext()) { // could also use hasNextLine()
                System.out.println(fileIn.nextLine());
            }
        }catch(IOException ex) {
            // there was an error finding the file or reading the file!
            // so how do you hand that? For now, we just say that and end the
            //program
            System.err.print("Error reading file!");
            ex.printStackTrace();
        }

    }
    public static void main(String args[]){
        readFile("file.txt");
    }
}
```
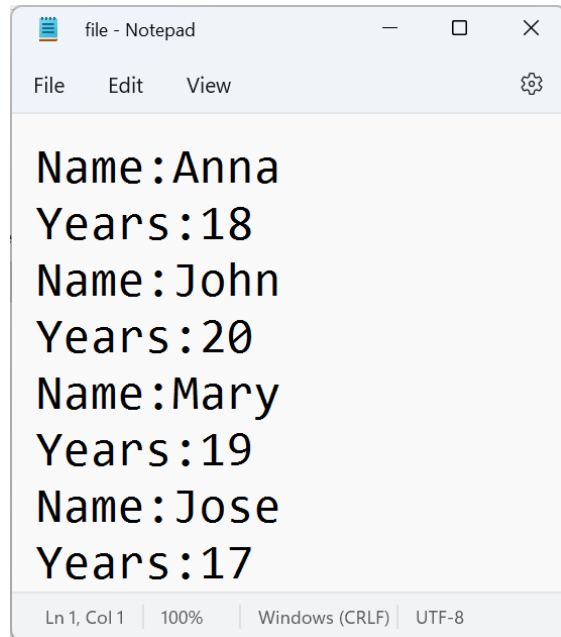

Creates a Scanner from a file

While still has elements

Reads the line

Test for the exception

What is printed?

```
